A review of the plan shows the entire slide text in the Microsoft PowerPoint and Open Office Impress presentation. The graphics are not shown in the Outline View review. This view is useful for editing purposes and can be printed for use as a summary handout. The instructions in this article apply to PowerPoint 2019, 2016, 2013, 2010; PowerPoint for Microsoft 365 and Open Office Impress. If you want to see the text only in the PowerPoint or Impress presentation, turn on the Outline View review. Go to the preview. Choose a path to show the text outline in the slide bar. The graphics are not displayed. To print the sketches, go to the file and select the print. Next to Layout on the print settings screen, select Outline from the list. Make any other changes to the print settings and choose the print to print the contour. PowerPoint includes several other viewing options. The one you choose depends on what you do at the time. In addition to the Outline View Review, which is used to create text-only contours, Powerpoint offers other views, including: Normal: Use this view when you're working on slides; this is where most of the slide editing takes place. It includes slides of the panel to the left of the screen, a large slide area, and a section at the bottom to write notes for the presentation. Switch the Notes panel and turn it off by selecting Notes in the state line at the bottom of the screen. To access the regular view, go to see and choose Normal or select Normal at the state bar. Slide Sorter: Organizes slide sketches horizontally. This view is useful if you want to change slides or view hidden slides. To access the Slide Sorter view, go to the view and select Slide Sorter or select Slide Sorter from the state bar. Note Page: Displays a smaller version of each slide and the speaker's notes that were entered at the bottom of each slide. You can print notes for the audience or for use only for the speaker. To view The Notes Page, go to the View and Note selection page. Like Firefox, OpenOffice also comes with extensions that you can use to improve its functionality. Here we have tested all the extensions and dealt with those that are useful for everyday use. Some are intended for public use, while some are only for the writer, Calc or Impress. (For those who haven't heard of OpenOffice before, this is a popular free alternative to Microsoft Office) Before you continue reading, here are some things you need to do/know: Let's move on to 9 must-have extensions for your OpenOffice. 1) OpenOffice usually allows you to export a file only to the PDF format, but not to import and make changes to it. With This PDF Import extension can now import PDF files and make changes to the date, numbers or even a small portion of the text. By default, this extension imports the PDF file to the Draw app rather than to Writer, even if it may contain a full page of text. You may be wondering why, but if you remember that when the PDF format was first created, it was don't allow editing at all. Thus, importing as a text document to a writer may prove too difficult to do. At the same time, capturing content as a Draw object now seems like the easiest and most logical thing to do. When you import a PDF file into the Draw app, each line of text will be treated as the object of the toss, and you can edit the text and rearrange it in your own way. Sun PDF Import Extension is still in beta and only works in OpenOffice 3.0. 2) With more than 120 professionally designed document templates at your fingertips, it's hard not to create a high-quality document or presentation. This extension adds different types of templates, from business correspondence, budgets and project plans, event posters, invoices, notes, minutes, press releases to personal email templates. You never have to waste your time writing the entire document again. Once installed, templates can be found under the file->new templates and documents. 3) This extension allows you to export and import documents from Google Docs, zoho and any WebDav server. Supported files include OpenDocument Text (.odt), StarOffice (.sww), Microsoft Word (.doc), Rich Text (.rtf), OpenDocument Spreadsheet (.ods), Microsoft Excel (.xls), Comma Separated Value (.csv) and Microsoft PowerPoint (.ppt, .pps). Java 6 is required to use this extension. If you're just like me who spends a lot of time sitting behind OpenOffice writing articles, then the writer's tools is an extension that you should have. Writer's Tools is a suite of tools designed to help OpenOffice users complete a wide range of tasks. You can back-up documents, search for and translate words and phrases, manage snippets of text, and keep track of document statistics. Some of the useful features of this extension include: Lookup word from several sources, including Cambridge Dictionaries, WordNet, and Google Define. Back up a copy of the current document by sending an email to the specified address. The Wikify Word tool links the chosen word or text fragment in the current document to the Writer document, which is created on the fly by a Fast Converter that makes it easy to convert between metric and imperial systems. The bookmarking tool allows you to bookmark commonly used documents so you can access them with a few clicks. Word of the Day selects and displays a random word and its definition from the WriterDB accompanying database. And more... 5) LanguageTool What's the use if you can't check grammar and other language errors in the Office set? LanguageTool extension is an open source language test for English, German, Polish, Dutch and other languages. It's based on rules, which means it'll find for which the rule is defined in XML configuration files. Rules for more complex errors can be written in Java. You may think of LanguageTool as a tool for detecting errors that a simple spell check can't detect, such as mixing there/their, no/now, etc. discover some grammatical errors. Expanding the language tool does not include spell-checking. 6) If you've always created open source projects with Creative Commons License, this extension will be useful to you. The Creative Commons Licensing Expansion provides the option to select and implement the Creative Commons license in Writer, Calc and Impress documents. 7) Data Form In the Excel app in Microsoft Office, there is this feature - Data ->Form - that makes it easy to key in the data. This extension should replicate this feature in OpenOffice. Expanding the data form generates data entry for tables in the Calc app, which can be used to enter values. In Calc, create a table with at least one line and a title, for example: Then click on the range or any cell of the newly created table (not on empty cells), and go to Data ->Form. That's it. There should be a form that will allow you to insert other records or edit old ones. 8) The modern Impress Template Modern Impress extension installs more than 30 beautiful templates that you can use for presentation. All graphics in the template are based on open source art. Once installed, you can access the template on file - new - It will take guesswork out of you as well as keep you away from troublesome paper notes sketched out with tiny text. This extension allows you to project different views onto different monitors and see the upcoming slide and note, while the audience sees only the current slide and slide effect. There are three views that you can set up in the presenter console. The first view shows the current audience-reading slide, while the second view displays the presenter's notes in a large, clear, and scalable type plus the current and upcoming slide. The third view is the kind of slider sorter with slide sketches. In the Impress app, go to the Slide Show settings, and you can decide what kind of slide will be projected onto each monitor. Do you use extensions for your OpenOffice? If so, which one is your favorite? How to build an inexpensive YouTube Studio: 7 things you need to learn how to create a dedicated YouTube studio and take your YouTube career to the next level. About author Damien Oh (42 Articles Published) More from Damien Oh OpenOffice Impress is a free presentation software that is included in OpenOffice, which is an office package that also includes a word processor, a spreadsheet program and a software database. There are tons of great presentation-making features in OpenOffice and it supports all the common file formats that other presentation programs use. Below are just a few of the file formats supported by OpenOffice OpenOffice particularly those that work with Impress. If you're using Impress as a microsoft PowerPoint replacement, you'll be happy to know that it can open PPTX files. PPTM, PPTX, POTM, POTX, PPT, PPS, POT, ODP, OTP, SXI, STI, SXD, CGM, UOP, UOF, ODG PPT, POT, ODP, OTP, SXI, STI, SXD, UOP, ODG, as well as HTML, PDF, SWF and image formats such as JPG, GIF, SVG, TIF, PNG, RAS, BMP OpenOffice works with Windows, Mac and Linux If you accept the default installation, you can also get other tools Such as OpenOffice, Calc, Base, Draw, and MathThere are OpenOffice Impress extensions you can install, and a free Impress templatesA master can guide you through creating a presentation with scratchA presentations can be viewed in the web browserSlides can be hidden, so you can keep them without displaying them during presentationKeyboard shortcuts can change me for multiple menu commands at the bottom of OpenOffice. Such as making the first letter of each word capitalized and changing all the letters into the lower register or uppercaseThe number of permitted undone steps can be changed to 100 stepsSlide Sorter makes it really easy to rearrange multiple slidesA number of slidesA number of slides transitions available like Shape Plus, Uncover Left, and Wipe DownTons toolbars can be shown or hidden and even separated from the main programCommon type options , size, color, and alignmentTables and diagrams can be used in OpenOffice ImpressVideo and audio files can be imported on slideNotes can be added to slidesSload animations can be selected from, like those for entry, accent, output, trajectory, and other types ofadvanced tools available as Color Replaces to replace up to four colors of the source at the same time with the user's level of tolerance and XML. notes. To include the current date and time, custom text, or the numberOpenOffice Impress slide page supports macroOver 10 layouts can be selected to organize content on slidesAdvanced style formatting is allowed for background objects, titles, subtitles and more such as changes in transparency, graphics, font, bullets, tabs, font effects, type of residence and more, bullets, computer images, finance photos, rulers, and many other types of imported graphicsA side menu is available for easy access to text properties , animations, styles, and gallerySeveral advanced options can be changed, such as the amount of memory OpenOffice Impress can use for graphics, whether hardware acceleration should be used, macro security settings, how often to save Information AutoRecovery, and custom websites to search the web there are so many features in the OpenOffice program to use Presentations. I especially like that you can use it in a portable form from something like a flash drive. However, I don't like that you have to download the entire office package just to use the Impress part. This means that you download and store files that are about 700MB of memory, even if you only want to use presentation software. Similarly, if you download the installed version, you should download the entire set at once, which may take some time to get if you have a slow internet connection. However, once you start installing it, you get the opportunity to only add Impress to your computer if you don't want other office tools. I also like that OpenOffice Impress can open up so many popular file formats. Some of the most common ones include those found in Microsoft PowerPoint, like POTM, POTX, and PPTM. The interface isn't too hard to navigate, but I believe the WPS Office Presentation program will be much easier and it even includes many of the same tools and features. You can download the portable version of OpenOffice with PortableApps.com.
